University Department Information Management System (UDIIMS)

This software concerns automating the activities of the Department offices of Universities. Department offices in different universities perform a lot of bookkeeping activities. The software to be developed targets automating these activities.

- Various details for each student, such as name, address, and registered course, are entered at the time of admission.
- At the beginning of each semester, students complete course registration. The information system should allow the department secretary to enter data on student course registrations. As the secretary enters each student's roll number, the computer system should display a form for that student and keep track of courses completed and those in backlog.
- At the end of the semester, instructors leave their grading information at the office, which the secretary enters into the computer. The information system should calculate each student's semester grade point average (GPA) and cumulative grade point average (CGPA), and print a grade sheet for each student.
- The information system also tracks departmental inventories, such as equipment, furniture, and their locations.
- The department receives an annual grant and uses it to purchase equipment, books, and stationery. In addition to the annual grant from the university, the department receives funds from various consultancy services it provides to organizations. The information system must track departmental accounts.
- The information system should also track departmental research projects and faculty publications. This information is keyed in by the department secretary.
- The information system should support queries for up-to-date details about every student by inputting their roll number. It should also support queries of the cash book account. The output of this query should include income, expenditure, and balance.
